

# SURFSUP 1 Trial GoPro Procedure

Site Specific - RIE

**Camera will be found in the locked draw with death certificates.**

Is pre-mounted so should only need clamping as below but can see instructions below if mount needs adjustment, straight forward, apart from removing rubber flap to allow it to slot in.

## Positioning

Infants in this study will be in an incubator so attaching the GoPro to the drip stand at the end of the incubator will work well.

The camera should be positioned to capture both:

- The infant's head/face for assessment of airway management and procedure times (avoid allowing any obstructions to observation of the procedure)
- The saturation and heart rate monitor screen, for recording of these variables

## Capturing Video

-Turn on using side switch, ensure on video mode start video using top button-double check that the seconds are counting and red light is flashing.

## Mounting the Camera

Lift the rubber flap in the mounting bracket and slide it onto the arm until locked in place as shown. Align the tabs on the lower surface of the camera with the slots on the mounting bracket, and lock into place with the screw until secure.
